## A MASTER PLAN FOR WATER CONSERVATION

When Stonebriar Village was established over 30 years ago, they laid out their master landscape plan with an eye towards water conservation.

### THE IMPORTANCE OF REUSE

Stonebriar Village utilizes grey water from the nearby golf course to water green belts and other public spaces. Making use of this non-potable water source allows them to water those areas without impacting our local water supply. In a few small areas, such as traffic islands, where they do utilize city water, Stonebriar Village has landscaped with native and adaptive plants and river rock in order to limit the amount of water required.

Now in the process of revising their master landscape plan, Stonebriar Village is maintaining that eye on water conservation by planning for the continued conversion of planted areas from water loving annuals to waterwise perennials.

## A Community Effort

The residents of Stonebriar Village jumped in to help with this effort with both feet. The Garden Club has established a butterfly garden where they experiment with various types of native and adaptive plants to determine which plants work best in their neighborhood.

Additionally, many residents have converted their lawns to under-sod drip irrigation, ensuring that the water they spend on their yards gets right to the roots. This helps to promote deep-root growth and a lawn that is better able to withstand drought.

Thank you Stonebriar Village for being mindful of your environmental impact and being a good neighbor to Frisco and Texas!
